

## Grow your own oak tree

### What you will need

- Acorns
- A small plant pot with drainage holes
- Peat-free compost
- Mesh (optional)
- A big plant pot

### Instructions

1. Fill a small plant pot with peat-free compost and plant two acorns.
2. Water the pot and place it outside. You may need to cover it with some mesh to protect it from predators.
3. Leave it to grow!
4. Once the roots start to emerge from the drainage holes you will need to re-pot it in a bigger pot.
5. After 1-2 years, once your oak tree reaches around 200mm high, it is ready to be planted. Make sure to choose a suitable place and remember that it could grow to be 45m high!
